Dear hiring team,

I am applying to Confidential Employer for the Data Labeling Specialist responsibilities described in the remote UX/UI Designer posting. My background combines regulated content review, enterprise UX research, and hands-on AI implementation. The common thread is careful evaluation: checking what a system produced, tracing it back to evidence, and making ambiguity visible before the work moves forward.

At Hedgehox, I designed Claims Detector as a human-reviewed MLR pre-screening workflow. It finds promotional claims, surfaces evidence gaps, and pre-populates audit-ready annotations so reviewers can focus on judgment instead of rebuilding the evidence trail. The broader platform also covers text, image, and video review, prompt-defined criteria, knowledge bases, and routing rules for regulated agency work.

At Kinesso, I built a research practice across more than 20 products using interviews, prototype testing, behavioral analytics, structured findings, and shared documentation. I also led quality reviews and helped define design and accessibility standards across an enterprise system used by more than 7,000 people. Earlier healthcare account work sharpened the same habits through detailed briefs, production requirements, MLR review, and deadline-driven delivery.

I would bring strong review judgment, clear written feedback, and direct experience with human-in-the-loop AI systems. My background does not include a dedicated high-volume data-labeling title or a documented daily annotation quota. The relevant experience is the work itself: reviewing structured and unstructured content, applying consistent criteria, catching gaps and edge cases, and keeping outputs usable for the people who make the final decision.

Sincerely,

Wally Mostafa
