Dear City of Durham Human Resources team,

I am applying for the Assistant Department Director of HR Operations and Service Delivery role because Durham's HR transformation is exactly the kind of operating challenge I know how to help stabilize: a major technology transition, a service model that needs clearer channels and standards, and leaders who need trustworthy data to understand what is happening across the organization.

I want to be direct about my path: I am not coming from a traditional municipal HR operations track, and I have not owned Oracle Fusion HCM as an HRIS administrator. What I do bring is 15 years of building service systems, workflow standards, analytics surfaces, and cross-functional teams in high-trust environments. My background sits at the intersection of operations, technology adoption, stakeholder support, data visualization, and team capacity-building.

At Kinesso, I helped scale a product design organization from 2 to 30 people across the US and Poland while leading enterprise analytics and workflow systems used by 7,000+ users across 22 white-label brands. That work required the same operating muscles Durham is asking for: standards, adoption, documentation, dashboards, quality expectations, leadership reporting, and alignment across product, technology, data, and stakeholder teams. I also helped shape service-desk concepts that connected user support needs with cleaner intake for the support team.

More recently at Hedgehox, I have converted regulated pharma agency operations into usable workflow tools: brief intake, scoping, submission capture, review routing, claim review, evidence gaps, and FDA signal monitoring. The Scope Generator work is especially relevant to this role because it turned rate cards, brands, sub-brands, natural-language scope changes, spreadsheet exports, and review-ready outputs into a clearer operational system for finance and operations teams.

What I would bring to Durham is a builder's discipline for HR service delivery: map the request paths, clarify who owns each tier of support, define service standards, make data visible, support managers with usable reporting, document the operating model, and help teams build enough internal capacity that the system keeps improving after implementation. I learn domains quickly, and my Rutgers degree in Labor Studies and Employee Relations gives me a real foundation for understanding the human side of this work.

I would welcome the chance to discuss whether my transformation, analytics, service-design, and team-building background can be useful as Durham stabilizes its HCM platform and rebuilds HR operations for the City's 2,800 employees.
