Dear BuildOps hiring team,

I am applying for the Product Manager, Mobile role at BuildOps. My background spans product strategy, enterprise UX, customer research, and hands-on product delivery. For more than six years, I have worked closely with product and engineering teams, turning open-ended needs into requirements, working product flows, roadmap decisions, and testable software.

At Kinesso, I led research and UX strategy for a 20+ product marketing intelligence suite used by 7,000+ people across 22 white-label brands. I built the company's first UX research practice with interviews, prototype testing, beta groups, behavioral analytics, and shared documentation. The work turned findings and adoption data into roadmap priorities for navigation, dashboards, personalization, and product support. One shipped workflow, Whitelabel Builder, grew from interviews with product managers and developers through requirements, workflow prototypes, usability testing, and release.

Today, through One Block Away, I lead discovery for client-led products and POCs. I frame the question, map the workflow, turn it into a testable product surface, and use the demo to make the next roadmap decision. Earlier account work taught me to write clear briefs, manage production requirements and timelines, and keep business, creative, UX, and development teams working from the same decision.

I am applying with responsibility-level product experience rather than a conventional Product Manager title sequence. The role would put my existing work into a more formal mobile-team cadence. BuildOps expects the person to deepen mobile technical expertise over time, and that is the honest growth edge in my background: I bring navigation, workflow, research, and product-engineering collaboration, but not prior ownership of native releases or offline synchronization.

I would welcome the chance to talk about how that background could support BuildOps' mobile team and the technicians who depend on it in the field.

Sincerely,

Wally Mostafa
